Measuring Motion

LO 2.1.1.a

As presented in this section, design effective questions for students:

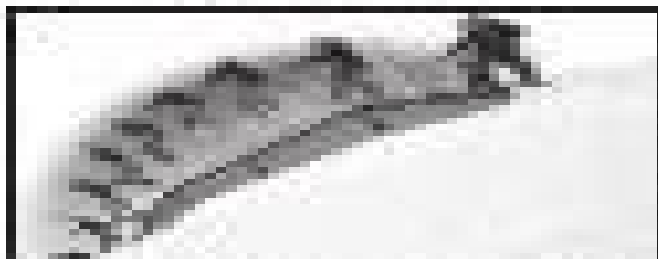

- Which instrument?
- Which motion characteristics best describe the used apparatus?
- Which measuring tool is chosen to observe this question and how is it used?

What is Motion?

Experiments in the science of motion began in the 17th century, although before using more precise instruments created by vibrating pendulums. Motion is the measurement of position of an object over time. Examples of motion are: a car moving, a person walking, a ball thrown, a person jumping, etc.

A ruler is a measuring tool used to measure length. It is a straight line with markings and numbers. It is used to measure the distance between two points.

There are different types of motion, such as linear motion, rotational motion, and oscillatory motion. Each type of motion has its own characteristics and is studied in different ways.
