Biological Clocks Yvan Touitou, 1998 Hardbound This volume comprises the lectures and a selection of communications presented at the International Congress on Chronobiology held in Paris in September 1997 During the last three decades it

has been shown that a number of physiologic functions are regulated by a system of clocks controlling basal levels of activity and responsiveness to changes in the environment. At the beginning of this century 1935 Erwin Bunning was the first to demonstrate that plants and insects still displayed circadian rhythms after they or their parents were raised in constant conditions. Later on he was the first to demonstrate that circadian clocks measure the length of the day. In the 1950s Colin Pittendrigh provided strong evidence that circadian phenomena are not learned but they display endogenous properties the periods of which are independent of environmental factors. Since then a number of investigations have extensively documented properties.
