

When the transformer is connected to the power source, the current flows through the primary winding, which is connected to the power source. The secondary winding, which is connected to the track, then provides the current to the train. The transformer is designed to provide a constant current to the track, regardless of the number of trains on the track. This is achieved by the use of a special winding arrangement, which allows the transformer to maintain a constant current output even when the load on the track varies.
