MICS reported high rates of malnutrition with 40.9 percent of children experiencing moderate to severe stunting. Furthermore, anecdotal reports show that food insecurity is one of the main reasons that eligible individuals will not initiate treatment; they fear not having food to take with ARVs. The Swaziland HIV Incidence Measurement Survey (SHIMS) published in late 2012 provides the best data available to date on the epidemic. SHIMS identified a national HIV prevalence of 31 percent among adults 18-49 years of age. A reanalysis of the 2007 Demographic Health Survey data determined prevalence of 31 percent in adults 18-49, indicating that the HIV prevalence in Swaziland has stabilized in the last five years. Adult incidence is high at 2.4 percent, with a significantly higher incidence for women of 3.1 percent and 1.7 percent for men.

Tanzania Operational Plan Report FY 2013 United States Department of State, 2014-11-12. Since 2004, PEPFAR Tanzania has been working closely with the United Republic of Tanzania and other donors, including the Global Fund to Fight AIDS, Tuberculosis, and Malaria, to respond to the HIV epidemic. PEPFAR, the GFATM, and the URT share a symbiotic relationship in Tanzania. While PEPFAR predominantly focuses on services and system strengthening, GFATM is responsible for commodity procurement and some systems strengthening, and the URT provides policy framework, infrastructure, systems, and personnel. Deficits in resources, governance, and health systems continue to complicate Tanzania's ability to adequately respond to HIV/AIDS. As a result, Tanzania's health programs, especially for HIV, are highly dependent upon donor funding. Foreign funds account for 97% of the Mainland's HIV/AIDS response, of which 90% come from the combined efforts of PEPFAR (74%) and the GFATM (16%). In addition, the country grapples with weak health infrastructure, shortages of health and social workers, high levels of stigma, cumbersome government procurement systems, weak management and strategic planning, and poor accountability. According to the 2011 UNAIDS Report on the Global AIDS Epidemic, adult HIV prevalence in the country is estimated at 5.8%, and an estimated 1.6 million Tanzanians are living with HIV, of which 1.3 million are OVC. An estimated 84,000 AIDS-related deaths occur in Tanzania each year. According to the 2007-08 Tanzania HIV and AIDS and Malaria Indicator Survey, the impact of the epidemic varies significantly by region, with the highest prevalence region, Iringa, estimated at 15.7%, and the lowest, Zanzibar, at 0.6%, and with a significant difference in prevalence between urban (9%) and rural (5%) areas. The data also reveal significant sex differentials in HIV prevalence, with male prevalence at 5% and female prevalence at 7%. A new THMIS was conducted in 2011-2012 and is due to be released in late March 2013. Despite a generalized epidemic, key populations play a critical role in HIV transmission dynamics. Data indicate that injection drug use, specifically heroin use, is on the rise in urban Tanzania and Zanzibar. Studies carried out in Dar es Salaam indicate that the HIV prevalence is 42% among people who inject drugs in 2007 and 31.4% among sex workers in 2010, while unpublished data for men who have sex with men in Dar es Salaam indicates prevalence over 30%. In 2012, PEPFAR support to Tanzania has enabled a dramatic increase in the number of adults and children accessing ART, with 364,000 individuals receiving treatment in FY2012. Also during FY2012, a total of 3,370,000 individuals received HIV testing.

and counseling 1 100 000 pregnant women were tested and counseled through PMTCT services 526 000 OVC received support and 152 000 VMMC took place

**Zambia Operational Plan Report Fy 2013** United States United States Department of State,2014-11-12 The recent 2012 UNAIDS World AIDS Day Report showed significant improvements in HIV and AIDS related results globally In general new HIV infections declined among children there were fewer AIDS related deaths and there were increased investments in the response to HIV and AIDS Zambia like many countries has recorded significant improvements in all three key areas According to the report between 2001 and 2011 Zambia reduced new HIV infections by 58% while the country also cut AIDS related deaths by more than 50% The 2007 Zambia Demographic and Health Survey 2007 ZDHS measured adult HIV prevalence at 14 3% With the population currently standing at 13 1 million people with 61% in rural areas and 39% in urban areas Zambia still has one of the world s most devastating HIV and AIDS epidemics with more than one in seven adults living with HIV Infection rates are twice as high in urban as in rural areas while life expectancy is estimated at 49 years in what is still a generalized epidemic UNAIDS Report on the Global AIDS Epidemic 2010 The HIV epidemic is geographically diverse with provincial prevalence levels ranging from 6 8% to 20 8% The Northern and Northwestern provinces have the lowest prevalence just below 7% Both provinces are predominantly rural with low population density and high levels of poverty In contrast Lusaka Central and Copperbelt Provinces are more densely populated with large urban areas and have prevalence levels of 17% and higher The most recent UNAIDS Report on the Global AIDS Epidemic 2012 UNAIDS estimated Zambia s HIV prevalence among 15 49 year olds to have declined to 12 5% The country is awaiting the results of the newly started DHS that will enable an update to the most recent HIV and AIDS statistics The six key drivers of the HIV and AIDS epidemic in Zambia are 1 high rates of multiple concurrent partnerships 2 low and inconsistent condom use 3 low rates of voluntary medical male circumcision VMMC 4 population mobility 5 vulnerable groups with high risk behaviors and 6 mother to child transmission MTCT In addition other factors such as gender inequality disparity socio cultural practices and stigma interact with these drivers to sustain high levels of risk and vulnerability

**Uganda Operational Plan Report Fy 2013** United States United States Department of State,2014-11-12 In September 2012 the Ministry of Health MOH released the results of the Uganda AIDS Indicator Survey UAIS 2011 which indicated that Uganda continues to experience a severe HIV epidemic HIV prevalence in the general population 15 to 59 years old is estimated to be 7 3% in 2011 compared to 6 4% in 2004 5 HIV prevalence is higher among women 8 3% than among men 6 1% Compared to the 2004 5 UAIS survey the magnitude of change in HIV prevalence varied across regions Central Western Southwestern and Northern regions remain the worst affected while modest declines in prevalence were recorded in the East Central and Mid Eastern regions Of particular concern is the rise in HIV prevalence among young people aged 15 24 years generally and in all age groups specifically in the West Nile and North East regions that previously were least affected UNAIDS projects the number of new annual infections at 150 000 2011 an increase from 120 000 in 2004

AIDS mortality is estimated at 62 000 deaths in 2011 the lowest estimate in a long decline since 2000 reflecting the significant expansion of ART The UNAIDS most recent World AIDS Day Report warned of increasing unprotected sex both sexes and multiple partners women The estimated number of people infected with HIV has risen to 1 39 million 55% of whom are female and 14% are children under the age of 15 years HIV is predominantly heterosexually transmitted accounting for 75 80% of new infections However population subgroups show that the most affected and the risk factors and drivers of HIV infections have evolved in recent years Studies show an HIV prevalence of 1 2% in university students 15 40% in fishing communities 37% among sex workers 18% in the partners of sex workers and 13% in the group of men with a history of having sex with men Strikingly 35% of new infections occur amongst self reported monogamous individuals which raises concerns regarding rising multiple concurrent partnerships The remaining transmissions are largely due to mother to child HIV transmission In response to the 2011 UAIS results PEPFAR revised its programmatic and technical approaches and targets to better respond to Uganda s escalating epidemic The 2013 COP is based on scientific evidence prioritized proven interventions resources matched effectively across subpopulations and efforts directed towards sources of new infections to assist the HIV AIDS epidemic response in Uganda The 2013 COP is the product of a consultative process that involved the GOU PEPFAR implementing partners IP and bilateral and multilateral donors

Zimbabwe Operational Plan Report Fy 2013 United States United States Department of State,2014-11-12 The country continues to experience a generalized HIV epidemic with an estimated 1 2 million HIV infected adults and children in 2011 and approximately 58 000 deaths each year Social cultural and economic factors contributing to HIV transmission include transactional sex multiple and concurrent partners alcohol abuse low awareness of HIV infection status lack of ART use in undiagnosed individuals poor treatment adherence and low levels of male circumcision MC While prevalence among youth has dropped significantly it is worth noting that prevalence among girls was twice that of boys of the same age HIV is the leading cause of death among adults and accounts for over 27% of all deaths among mothers and infants Maternal mortality

rate nearly tripled between 1994 and 2010 Zimbabwe's TB case rate 603 per 100 000 is one of the highest in the world The TB epidemic in Zimbabwe is largely HIV driven with a very high TB HIV co infection rate at 80% with an increasing number of MDR and XDR cases TB is the second leading cause of adult morbidity and mortality in Zimbabwe National Response The National AIDS Council NAC and the Ministry of Health and Child Welfare MOHCW lead the national HIV AIDS response and have outlined their goals in Zimbabwe National Strategic Plan ZNASPII 2011 2015 While the level of institutional leadership within the MOHCW is high in terms of technical direction and policy setting the capacity for implementation continues to be limited For the MOHCW low capacity is largely an outcome of limited national resources for programming which affects its capacity to deploy and adequately train sufficient experienced health professionals provide adequate commodities and provide a high level of monitoring and supervision to ensure high quality service delivery As such donor resources have been essential to national prevention care treatment and health systems strengthening HSS efforts The majority of HIV AIDS related activities are donor funded Nevertheless Zimbabwe has not received the magnitude of donor funding that countries with similar HIV burden have been fortunate to access Zimbabwe is facing potential critical shortages of key inputs to achieve ambitious goals particularly in the areas of treatment prevention of mother to child transmission PMTCT and MC
