Pavement surface texture is measured in a variety of ways in Virginia Two methods commonly used are ASTM E 965
Standard Test Method for Measuring Pavement Macrottexture Depth Using a Volumetric Technique known as the sand patch
test and ASTM E 2157 Standard Test Method for Measuring Pavement Macrottexture Properties Using the Circular Track CT
Meter In September 2005 staff from the Virginia Transportation Research Council inquired about using the Digital Surface
Roughness Meter DSRM to measure the surface texture of several concrete and asphalt surfaces Measurements were taken
on concrete and asphalt surfaces using the DSRM CT meter and sand patch test and the results were compared From the
data obtained there appears to be a good correlation among the results of the three methods The DSRM and sand patch tests
appear to be more accurate on surfaces that are not uniform However this may be because the center of the rotating arm of
the CT meter may have missed particular non uniform areas on the testing surface The use of the DSRM and CT meter
devices also reduces the probability of human error The sand patch test is exposed to a greater probability of human error it
is a test that cannot be performed quickly without comprising accuracy The DSRM is a better device to use under a time
