Measurements Modelling And Simulation Of Dynamic Systems:

Measurements, Modelling and Simulation of Dynamic Systems Edward Layer, Krzysztof Tomczyk, 2009-12-30 The development and use of models of various objects is becoming a more common practice in recent days This is due to the ease with which models can be developed and examined through the use of computers and appropriate software Of those two the former high speed computers are easily accessible nowadays and the latter existing programs are being updated almost continuously and at the same time new powerful software is being developed Usually a model represents correlations between some processes and their interactions with better or worse quality of representation It details and characterizes a part of the real world taking into account a structure of phenomena as well as quantitative and qualitative relations There are a great variety of models Modelling is carried out in many diverse fields All types of natural phenomena in the area of biology ecology and medicine are possible subjects for modelling Models stand for and represent technical objects in physics chemistry engineering social events and behaviours in sociology financial matters investments and stock markets in economy strategy and tactics defence security and safety in military fields There is one common point for all models We expect them to fulfil the validity of prediction It means that through the analysis of models it is possible to predict phenomena which may occur in a fragment of the real world represented by a given model We also expect to be able to predict future reactions to signals from the outside world

Measurements, Modelling and Simulation of Dynamic Systems Edward Layer, Krzysztof Tomczyk, 2010 This book discusses an analog to digital system intended to dynamic measurement particularly for non electrical quantities The construction and properties of measurement sensors are analyzed in detail as these represent the primary components for all measurement systems Procedures for signal noise reduction are presented based on the time window function and a digital Kalman filter Also covered in this book are the methods of modeling model development and identification procedures on the basis of measurement data The theory of maximum errors is applied in order to determine mapping errors of models in case of non standard input signals This is based on signals maximizing the chosen error functional The existence and attainability of such signals is proved and the algorithms for their determination are presented Detailed calculation methods based on dedicated numerical procedures are demonstrated which allow the integral square error as well as the absolute error to be determined The problems presented in the book are relevant to a wide range of applications where there is a requirement to determine the accuracy of indeterminate dynamic signals such as occurs in the fields of engineering medicine biology physics etc This book will interest researchers scientists engineers and graduate students in many disciplines who make use of measurements modelling and computer simulation

methods covered have been used successfully in practical applications for many different processes. Illustrative examples in this book with real measured data range from hydraulic and electric actuators up to combustion engines. Real experimental data is also provided on the Springer webpage allowing readers to gather their first experience with the methods presented in this book. Among others, the book covers the following subjects: determination of the non-parametric frequency response, fast Fourier transform correlation analysis, parameter estimation with a focus on the method of Least Squares and modifications, identification of time variant processes, identification in closed loop, identification of continuous time processes and subspace methods. Some methods for nonlinear system identification are also considered such as the Extended Kalman filter and neural networks. The different methods are compared by using a real three mass oscillator process, a model of a drive train. For many identification methods, hints for the practical implementation and application are provided. The book is intended to meet the needs of students and practicing engineers working in research and development, design and manufacturing.
