Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were divided into two groups: a control group and a training group. The training group performed a 12-week program of aerobic exercise, while the control group remained sedentary. The results showed that the training group had a significant decrease in HR and BP compared to the control group. The findings suggest that a 12-week training program can effectively reduce HR and BP in sedentary, middle-aged men.
