Damos, Sibylle C. Stoeckli, Alexandros Rigas, 2018-06-12 The current eBook collection includes substantial scientific work in

describing how insect species are responding to abiotic factors and recent climatic trends on the basis of insect physiology and population dynamics The contributions can be broadly split into four chapters the first chapter focuses on the function of environmental and mostly temperature driven models to identify the seasonal emergence and population dynamics of insects including some important pests The second chapter provides additional examples on how such models can be used to simulate the effect of climate change on insect phenology and population dynamics The third chapter focuses on describing the effects of nutrition gene expression and phototaxis in relation to insect demography growth and development whilst the fourth chapter provides a short description on the functioning of circadian systems as well as on the evolutionary dynamics of circadian clocks

Biological Clocks Yvan Touitou, 1998 Hardbound This volume comprises the lectures and a selection of communications presented at the International Congress on Chronobiology held in Paris in September 1997 During the last three decades it has been shown

that a number of physiologic functions are regulated by a system of clocks controlling basal levels of activity and responsiveness to changes in the environment At the beginning of this century 1935 Erwin Bunning was the first to demonstrate that plants and insects still displayed circadian rhythms after they or their parents were raised in constant conditions Later on he was the first to demonstrate that circadian clocks measure the length of the day In the 1950s Colin Pittendrigh provided strong evidence that circadian phenomena are not learned but they display endogenous properties the periods of which are independent of environmental factors Since then a number of investigations have extensively documented properties
