**Winter Storm to Microphysics Parameterization and Microphysics Processes Over Colorado and Wyoming** Ethan Collins,2019 Accurate weather forecasts are crucial to the profitability of industry in the United States such as the transportation of goods across the country via semi trailer trucks air travel recreation activities etc This topic is of particular concern over the state of Wyoming as wintertime weather forecasts are often prone to error Wyoming not only has a sparse network of surface and upper air observations but also complex terrain that cannot be properly represented in regional numerical models Model forecast errors can have a substantial impact on the ability to issue advisories and close highways if necessary We focus on improving our understanding of why regional numerical weather prediction NWP models often fall short of predicting accurate snow totals via a case study of an event that occurred on February 22 24 2017 High resolution simulations are run using the Weather Research and Forecasting WRF model Four different microphysics parameterizations are utilized in this study Thompson Morrison two moment Predicted Particle Properties P3 and the WRF Single Moment 6 Class Scheme The coupling between cloud properties and radiation as well as the role of latent heat release due to individual microphysical processes are also explored The simulated precipitation is compared with both Snow Telemetry SNOTEL and Parameter elevation Relationships on Independent Slopes Model PRISM to quantify model errors and improvements using higher resolution simulations and advanced microphysical parameterizations The results support past studies that suggest a dependency exists regarding the choice of microphysics parameterization and resolution over this region All of the parameterizations utilized in this study overpredict snowfall accumulation no clear bias as a function of altitude is identified The coupling between the cloud microphysics and radiation is also found to have a minimal impact on storm strength storm track and snowfall amounts Lastly certain microphysical processes and the resultant latent heating are found to affect the storm characteristics No cooling due to sublimation and no warming due to deposition have the largest influences on snowfall accumulation and cyclone track No cooling due to sublimation was found to decrease negative buoyancy production resulting in deeper clouds and more snowfall accumulation While no warming due to deposition was found to reduce

buoyancy production deeper clouds and thus less snowfall accumulation Furthermore reducing ice fall speeds by 50 % was found to increase snowfall accumulation while increasing ice fall speeds by 50 % was found to decrease snowfall accumulation
