

■ ELECTRICAL SYSTEM

(1) CHARGING SYSTEM

(a) Alternator

A compact alternator with an IC regulator is used, having the following characteristics:

- Cooling performance and safety have been improved by containing the cooling fan with the rotor and incorporating the fan / rotor unit inside the alternator.
- IC regulator is fixed inside the alternator.
- The output IC regulator and similar components are easy to remove, making it easier to service the alternator.

PREVENTION

(b) IC Regulator

An IC regulator uses solid state transistors, diodes or other semiconductor elements instead of the relay in a conventional regulator. Basic characteristics are achieved by cutting off the field current.

IC regulators have the following characteristics:

- The control voltage does not change over time, so the need for readjustment is eliminated. Since there are no moving parts, IC regulators are extremely durable and resistant to vibration.

• The overheat compensation characteristic ensures that the control voltage is reduced as the temperature rises, so the battery is charged at just the right level. The internal circuitry of the IC regulator is shown in the diagram. It consists of a hybrid IC incorporating a monolithic IC. (The internal circuitry of the monolithic IC is extremely complex, so it is shown as simply "MONO IC circuit".)

To add to the controls controlling the field current and the add-on the charge lamp relay controlling the flashing of the charge lamp.

The IC circuit controls the fan and the, and monitors the alternator output voltage, and detects any drop in terminal voltage or density in the battery cell.
