

Meiosis

Meiosis is the special form of cell division used to produce gametes. It has two important functions:

- To form haploid cells with half the normal chromosome number
- To re-arrange the chromosomes with a novel combination of genes (genetic recombination)

Meiosis comprises two successive divisions, without DNA replication in between. The second division is a bit like mitosis, but the first division is different in many important respects. The details are shown in this diagram for a hypothetical cell with 2 pairs of homologous chromosomes ($n=2$):

| First Division | | Second Division | |
|---|--|---|---|
| Interphase I <ul style="list-style-type: none"> • chromatin not visible • DNA & proteins replicated |  | Interphase II <ul style="list-style-type: none"> • Short • no DNA replication • chromosomes remain visible. |  |
| Prophase I <ul style="list-style-type: none"> • chromosomes visible • homologous chromosomes join together to form a <u>bivalent</u> |  | Prophase II <ul style="list-style-type: none"> • centrioles replicate and move to new poles. |  |
| Metaphase I <ul style="list-style-type: none"> • bivalents line up on equator |  | Metaphase II <ul style="list-style-type: none"> • chromosomes line up on equator. |  |
| Anaphase I <ul style="list-style-type: none"> • chromosomes separate (not chromatids- centromere doesn't split) |  | Anaphase II <ul style="list-style-type: none"> • centromeres split • chromatids separate. |  |
| Telophase I <ul style="list-style-type: none"> • nuclei form • cell divides • cells have 2 chromosomes, not 4 chromatids. |  | Telophase II <ul style="list-style-type: none"> • 4 haploid cells, each with 2 chromatids • cells often stay together to form a <u>tetrad</u>. |  |
