

4. Window Comparator

The comparator described in Project 3 tells us if the input voltage is higher or lower than the reference voltage. By combining two comparators, you can tell if the input voltage is between two set values, or limits. This is called a window comparator because it seems that a window is open between the lower and upper limits.

Connect the circuit as shown in the wiring sequence. After you connect the wires, rotate the control. As you turn it, the input voltage varies between 0 and 6V. The lower and upper limits set by the two comparators are at 3.1 and 4.6V, so the window opens (and LED1 lights) when the input voltage is in the range between these values.

Rotate the control fully counterclockwise once, and then slowly clockwise. LED1 turns on at one point, then goes out at another point as you rotate it further. The range where LED1 lights shows where the window comparator is open.

The reference voltages are applied to the positive (+) terminals of the OP AMPs. About 4.6V is applied to the upper OP AMP to set the upper limit; about 3.1V is applied to the lower OP AMP to set the lower limit.

When the input voltage is lower than 3.1V, the lower comparator outputs voltage and LED1 does not light. When the voltage is between 3.1V and 4.6V, the lower comparator does not output voltage but the upper one does, so LED1 lights. When the input voltage exceeds 4.6V, the upper comparator also stops outputting voltage, so LED1 turns off.

Wiring Sequence:
