DIFFERENCES BETWEEN MITOSIS AND MEIOSIS

<u>MEIOSIS:</u>	<u>MITOSIS:</u>
<ul style="list-style-type: none">• Meiosis involves 2 cell divisions• Meiosis gives rise to sex cells• Cells produced are haploid• Differs according to gender• 2 phases• 4 daughter cells formed• Half the number of chromosomes to the parent cell• All cells formed are genetically different to each other and parent cell• Cells responsible for genetic variation in reproduction	<ul style="list-style-type: none">• Mitosis involves 1 cell division• Gives rise to somatic cells• Cells produced are diploid• Has no gender specification• One phase• 2 daughter cells formed• Same number of chromosomes as parent cell• Genetically identical to each other and parent cell• Cells responsible for growth and repair

DIFFERENCES BETWEEN MEIOSIS I AND MEIOSIS II

<u>MEIOSIS 1</u>	<u>MEIOSIS 2</u>
<ul style="list-style-type: none">• Crossing over occurs in prophase 1• Chromosomes arranged at the equator in homologous pairs in metaphase i• Homologous chromosomes pairs separate• Whole chromosomes are pulled to opposite poles in anaphase I• 2 diploid daughter cells produced	<ul style="list-style-type: none">• No crossing over occurs• Chromosomes arranged singly at the equator in metaphase ii• Sister chromatids separate• Chromatids are pulled to opposite poles in anaphase ii• 4 haploid daughter cells produced

THE IMPORTANCE OF MEIOSIS

- Production of haploid gametes
- The halving effect of meiosis overcomes the doubling effect of fertilisation, thus maintaining a constant chromosome number from one generation to the next
- Mechanism to introduce genetic variation through:
 - Crossing over
 - The random arrangement of chromosomes at the equator

ABNORMAL MEIOSIS

Non-disjunction and its consequences

- Non-disjunction of chromosome pair 21 during Anaphase I in humans to form abnormal gametes with an extra copy of chromosome 21
- The fusion between an abnormal gamete (24 chromosomes) and a normal gamete (23 chromosomes) may lead to Down syndrome

Neuronal Self-Defense:

Compensatory Mechanisms in Neurodegenerative Disorders Rosanna Parlato, Pier Giorgio Mastroberardino, 2016-02-26 Neurodegenerative disorders are characterized by the progressive loss of specific populations of neurons with consequent deterioration of brain s function and dramatic impact on human behavior At present there are no effective cures for neurodegenerative diseases Because unambiguous diagnosis is possible only after manifestation of symptoms when a large proportion of neurons has been already lost therapies are necessarily confined to alleviation of symptoms Development of cures halting the disease course is hampered by our rudimentary understanding of the etiopathology Most neurodegenerative disorders are sporadic and age related and even for those of known genetic origin the mechanisms influencing disease onset and progression have not been fully characterized The different diseases however share important similarities in the mechanisms responsible for neuronal loss which is caused by a combination of endogenous and exogenous challenges Trophic deprivation oxidative stress accumulation of abnormal protein aggregates and bioenergetics defects have been described in most if not all neurodegenerative disease To counterbalance these noxious stimuli cells deploy at least during the initial pathogenic states intrinsic neuroprotective responses These are general compensatory mechanisms common to several neurodegenerative conditions which reprogram cellular physiology to overcome stress Adaptation includes strategies to optimize energetic resources for instance reduction of rRNA synthesis to repress translation suppression of transcription and bioenergetics and metabolic redesign Additional mechanisms include potentiation of antioxidant capacity induction of endoplasmic reticulum ER stress and activation of protein quality control systems and autophagy Ineffective execution of these compensatory strategies severely threatens cellular homeostasis and favors onset of

pathology Therefore a better understanding of these buffering mechanisms and of their interconnections may help to devise more effective therapeutic tools to prolong neuronal survival and activity independently of the original genetic mutations and stress insults This Research Topic focuses on the initial compensatory responses protecting against failure of those mechanisms that sustain neuronal survival and activity The collection intends to summarize the state of the art in this field and to propose novel research contributes with the ultimate goal of inspiring innovative studies aimed to contrast progression of neurodegenerative diseases Biochemicals and Reagents for Life Science Research Sigma Chemical
