

# PIGEON DISSECTION

**INTRODUCTION:** Members of Class Aves are vertebrates whose body plan is adapted to the requirements of flight.

For example, the skeletal system is lightweight but strong. The flight muscles of the chest make up 15% of the total weight of the bird's body. Birds have extremely high energy requirements because of their higher metabolic rate. The unique air sacs of their respiratory system provide them with a continuous supply of oxygen and help to compensate for the smaller size of their lungs. Birds have unique needs, that include a streamlined, lightweight body, smaller reproductive organs and some are inactive for most of the year. During the breeding season, however, the male and the female reproductive organs increase greatly in size to prepare for the production of offspring.

**PURPOSE:** In this dissection, you will explore the unique structural features of birds through study of the pigeon.

**MATERIALS NEEDED:** preserved pigeon (provided), dissecting tray, forceps, scissors, magnifying glass, paper

## PROCEDURE

### EXTERNAL OBSERVATIONS

1. Obtain a preserved pigeon from your teacher then rinse it at the sink with water. Place the pigeon ventral side up on a dissecting tray.
2. Spread out one wing so that the different types of feathers are more easily visible.
  - Use the diagram below and your notes to determine the different types of feathers you see before you.
3. Pull out one of the primary feathers and examine it with a magnifying glass.
4. Locate the long, slender, hollow **SHAFT**. From the shaft, you will note that barbs extend outward at an angle of about 45 degrees.
5. With your fingers, gently pull apart the barbs. Notice that they are formed of still smaller **BARBELS** with interlocking hooks.
6. Examine the barbs and the barbel with a dissecting microscope and sketch (in detail) what you see.
