

Lambda Expressions

Lambda expressions are a concise way to represent anonymous functions in Java.

They provide a shorthand notation for writing code by allowing the creation of small, inline implementations of functional interfaces.

Lambda expressions consist of parameters, an arrow token (\rightarrow), and a body.

```
// Assumes the interface can have just one method
@FunctionalInterface
interface SumFunction {
    int sum(int a, int b);
}

public class LambdaExample {

    public static void main(String[] args) {
        SumFunction sumFunction = (a, b) -> a + b;
        int result = sumFunction.sum(5, 3);
    }
}
```

Functional interfaces are Java interfaces that contain exactly one abstract method. They serve as

The world before Lambda

This is the same example rewritten as a standard anonymous inner class:

```
interface SumFunction {
    int sum(int a, int b);
}

SumFunction sumFunction = new SumFunction() {
    @Override
    public int sum(int a, int b) {
        return a + b;
    }
};

int result = sumFunction.sum(5, 3);
```

All functional interfaces implement exactly one method, which allows for syntactic sugar to implement that one method with much less code.

$() \rightarrow$ expression | statement
 param \rightarrow expression | statement
 (param) \rightarrow expression | statement
 (param) \rightarrow { expressions and statements }
 (types) (param) \rightarrow { expressions and statements }

not to provide a container for a value that may or may not be present.

If Optional is to handle the scenario where a method might return a result.

```
Optional<String> optional = Optional.ofNullable(value);

// Optional is null
optional.map(s -> s.toUpperCase());

// Optional is not null
optional.map(s -> s.toUpperCase());

// Optional is null
optional.map(s -> s.toUpperCase());

// Optional is not null
optional.map(s -> s.toUpperCase());

// Optional is null
optional.map(s -> s.toUpperCase());

// Optional is not null
optional.map(s -> s.toUpperCase());
```

For those an Exception

```
optional.map(s -> s.toUpperCase());
optional.map(s -> s.toUpperCase());
```

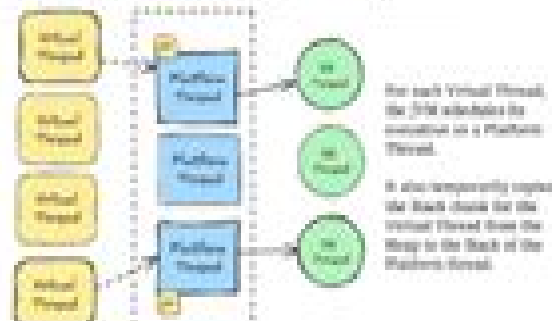

Lambda Expressions avoid a statements to check if a value

Java Modules

Java Modules

A module is a group of closely related packages and resources along with a module descriptor file.

A module has a descriptor named `module-info.java`, located in the module's root directory.

The `module-info.java` file contains information about the module, including its name, dependencies on other modules, and what it exports (makes publicly accessible) or encapsulates (hides).

Each module is a self-contained unit of code that can be used by other modules.

- Module Type**
 - Application Module** - This module type is used for applications. It contains a `main` method and can be executed directly.
 - Library Module** - This module type is used for libraries. It contains classes and resources that are used by other modules.
 - Service Module** - This module type is used for services. It contains classes that implement interfaces defined in other modules.

Java Records

Java Records

Records are special classes designed to make it easier and safer to create classes whose primary purpose is to store data, and they are particularly useful for modeling immutable data.

```
Record classes are immutable by default. Their state cannot be changed once they are created.

Record Example:
public record Person(String name, int age) {
    // ...
}
```

Records are designed to be used in a way that is similar to how they are used in other languages. They are particularly useful for modeling immutable data.
