*Modern Celestial Mechanics: From Theory to Applications* Alessandra Celletti, Sylvio Ferraz-Mello, Jacques Henrard, 2013-06-29 At the opening of the Third Meeting on Celestial Mechanics CELMEC III strong sensations hit our minds The conference 18-22 June 2001 was being held in Villa Mondragone a beautiful complex of buildings and gardens located within the township of Monte Porzio Catone on the hills surrounding Rome A former papal residence the building has been recently restored by the University of Rome Tor Vergata to host academic activities and events The conference room is called Salone degli Svizzeri here Gregory XIII on February 24 1582 gave its sanction to the reform of the Julian calendar and declared officially in use the calendar still adopted nowadays The magnificent high walls and tall ceiling strongly resounded giving to our voice a peculiar Vatican sound which took us by surprise May be we thought a distant echo of the very words of Gregory XIII proclaiming the modern calendar was still haunting the room Around us in the audience many countries were represented thus indicating that the idea of putting together the three souls of modern Celestial Mechanics perturbation theories solar and stellar system studies spaceflight dynamic had been successful CELMEC III is in fact the latest of a series of meetings the first two editions took place in 1993 and 1997 in L'Aquila Italy whose aim is to establish a common ground among people working in Celestial Mechanics yet belonging to different institutions such as universities astronomical observatories research institutes space agencies and industries

increasingly complicated models of such media as giant molecular clouds giving birth to stars protoplanetary accretion disks associated with the solar system s formation planetary atmospheres and circumplanetary space The creation of these models was promoted by the development of basic approaches in modern chanics and physics paralleled by the great advancement in the computer sciences As a result numerous multidimensional non stationary problems involving the analysis of evolutionary processes can be investigated using wide range numerical experiments Turbulence belongs to the most widespread and at the same time the most complicated natural phenomena related to the origin and development of organized structures dies of different scale at a definite flow regime of fluids in essentially non linear drodynamic systems This is also one of the most complex and intriguing sections of the mechanics of fluids The direct numerical modeling of turbulent flows encounters large mathematical difficulties while the development of a general turbulence theory is hardly possible because of the complexity of interacting coherent structures Three dimensional non steady motions arise in such a system under loss of la nar flow stability defined by the critical value of the Reynolds number      *Orbital Mechanics* Howard D.
