**Mechanistic-empirical Pavement Design Guide Implementation Plan** Todd E. Hoerner, 2007 As AASH is expected to eventually adopt the MEPDG at its primary pavement design method it is critical that the SDDOT become familiar with the MEPDG documentation and associated design software The research conducted under this project was a first step toward achieving this goal      Guide for the Local Calibration of the Mechanistic-empirical Pavement Design Guide, 2010 This guide

provides guidance to calibrate the Mechanistic Empirical Pavement Design Guide MEPDG software to local conditions policies and materials It provides the highway community with a state of the practice tool for the design of new and rehabilitated pavement structures based on mechanistic empirical M E principles The design procedure calculates pavement responses stresses strains and deflections and uses those responses to compute incremental damage over time The procedure empirically relates the cumulative damage to observed pavement distresses      **Database Support and**

Brhanemeskel, 2017 The Wyoming Department of Transportation WYDOT has been working to fully implement MEPDG as their pavement design guide To facilitate this implementation many research works have been completed Similarly this thesis was completed to evaluate the relationships between subgrade resilient modulus  $M_r$  and the dynamic cone penetration DCP and the standard penetration test SPT results select three best subgrade  $M_r$  predictive models based on both  $M_r$  and distress estimations determine the sensitivity of the pavement design parameters on pavement distresses in Wyoming and facilitate implementation of the MEPDG in the state of Wyoming Two resilient modulus  $M_r$  predictive models were developed from the dynamic cone penetration DCP and the standard penetration test SPT results To enhance the prediction of pavement performance distresses 11 subgrade  $M_r$  predictive models were evaluated and three best models were identified and selected

Sensitivity of pavement distresses to influential variables was assessed. All pavement distresses were found to be sensitive to asphalt concrete thickness and most of the distresses were found to be non sensitive to asphalt concrete AC grade base thickness and base Mr. Finally pavement design comparisons were made between the WYDOT 2012 user design guide and the recommended design guide based on locally calibrated properties. The average overall cost per square yard of the pavement structure designed using the WYDOT 2012 user design guide was found to be 21% higher than that based on the recommended design guide.

The Kansas Department of Transportation KDOT is moving toward the implementation of the new American Association of State Highway and Transportation Officials AASHTO Mechanistic Empirical Pavement Design Guide MEPDG for pavement design. The MEPDG provides a rational pavement design framework based on mechanistic empirical principles to characterize the effects of climate, traffic and material properties on the pavement performance as compared with the 1993 AASHTO Guide for Design of Pavement Structures. Before moving to the MEPDG, the nationally calibrated MEPDG distress prediction models need to be further validated and calibrated to the local condition. The objective of this research was to improve the accuracy of the MEPDG to predict the pavement performance in Kansas. This objective was achieved by evaluating the MEPDG predicted performance of Kansas projects as compared with the pavement performance data from the pavement management system PMS and calibrating the MEPDG models based on the pavement performance data. In this study, 28 flexible pavement projects and 32 rigid pavement projects with different material properties, traffic volumes and climate conditions were strategically selected throughout Kansas. The AASHTO ME Design software Version 1.3 was used in this study. The comparisons between the MEPDG predicted pavement performance using the nationally calibrated models and the measured pavement performance indicated the need for the calibration of the MEPDG models to the Kansas conditions.

For new flexible pavements the MEPDG using the nationally calibrated models overestimated the rutting due to the overprediction of the deformation of the subgrade layer. Biases also existed between the predicted top down cracking, thermal cracking, and International Roughness Index (IRI) and the measured data. The relationship between the measured and the predicted IRIs was more obvious than that for the cracking. Using the coefficients determined through local calibration in this study, the biases and the standard errors were minimized for all the models based on the statistical analysis. For new rigid pavements, very low mean joint faulting was measured in actual projects as compared with the default threshold of the MEPDG. The type of base course had a minor effect on the pavement performance. The traditional splitting data method was adopted in the process of local calibration. After the local calibration, the biases between the predicted pavement performance, mean joint faulting, and IRI and the measured pavement performance were minimized, and the standard errors were reduced.
