- A plan for the investigation, including the dependent variable.
- A plan for the investigation, including the control group.

**Why is experimental design important?**

It allows scientists to determine if the results of an experiment are due to the independent variable or to other factors.

**What are the components of an experiment?**

- **Independent Variable:** The variable that is being tested or manipulated.
- **Dependent Variable:** The variable that is being measured or observed.
- **Control Group:** A group that is not receiving the treatment or intervention.
- **Experimental Group:** A group that is receiving the treatment or intervention.

**How do you design an experiment?**

2. Formulate a hypothesis.
3. Design the experiment, including the independent and dependent variables.
4. Conduct the experiment.
5. Analyze the results.
6. Draw conclusions.

**What are some common mistakes in experimental design?**

- **Confounding Variables:** Variables that are not being controlled for and may affect the results.
- **Sampling Bias:** A sample that is not representative of the population.
- **Lack of Replication:** Not repeating the experiment enough times to ensure the results are reliable.

**How can you avoid these mistakes?**

- **Control Variables:** Keep all other variables constant.
- **Randomization:** Randomly assign subjects to groups.
- **Replication:** Repeat the experiment multiple times.

**What is a control group?**

A control group is a group of subjects that does not receive the treatment or intervention being tested. It is used to compare the results of the experimental group to a baseline.

**What is an experimental group?**

An experimental group is a group of subjects that receives the treatment or intervention being tested. It is used to see if the treatment has an effect on the dependent variable.

**How do you interpret the results of an experiment?**

Look for differences between the control and experimental groups. If there is a significant difference, it suggests the treatment had an effect. If not, it suggests the treatment had no effect.

**What is a bar graph?**

A bar graph is a chart that displays data using vertical bars. The height of each bar represents the value of the dependent variable for a specific category on the x-axis.

**How do you read a bar graph?**

Look at the x-axis to identify the categories. Look at the y-axis to identify the scale. Compare the heights of the bars to see which category has the highest or lowest value.

**What is a line graph?**

A line graph is a chart that displays data using a line with markers. The line connects the data points, showing the trend of the dependent variable over time or across categories.

**How do you read a line graph?**

Look at the x-axis to identify the categories or time points. Look at the y-axis to identify the scale. Follow the line to see how the dependent variable changes.
