

Lithology Identification

Identifying lithology is an important qualitative application of resistivity and porosity logs, but it can also be one of the most challenging. No logging tool directly measures lithology, but almost every measurement presented on a log (even a caliper!) responds to changes in rock type. Piecing together evidence provided by different measurements can, in many cases, allow for a very conclusive determination of lithology.

Shale shows characteristic resistivity and spontaneous potential (SP) responses. Identifying sandstone may only require a quick glance at the photoelectric factor (Pe) curve on a density log, but other reservoir rocks like limestone and dolomite may require consideration of their porosity responses. Identifying mixed mineralogies (e.g., shaly sandstone) may require consideration of almost every measurement presented.

Quick-look lithology identification is a qualitative process that initially involves Pe values and pattern recognition of porosity responses. Clues provided by other measurements help improve the method's effectiveness. This section introduces the "classic" responses of common lithologies, and lays the foundation for using resistivity and porosity logs to identify them.

Measurements Providing Lithology Indications

Simple is best, but simple can be dangerous. Relying exclusively upon gamma ray and Pe responses can easily provide misleading clues as to a reservoir's lithology. For example, suppose a formation has some "low" gamma ray response and $Pe \approx 5$. The rock could be limestone, but it may also be anhydrite. Similarly, a rock with $Pe \approx 3$ could be dolomite, but it may be a shaly sandstone or a mixture of sandstone and limestone. Confirmation of lithology requires a cross-check of porosity and other curve responses.

The best process for identifying lithology uses responses from all of the measurements presented on resistivity and porosity logs. In many cases it is a process of elimination. The Pe response may initially indicate more than one possible lithology, but other responses can often be used to narrow
