Miscellaneous Light Topics

Total Internal Reflection

Light usually passes through clear boundaries, but if it strikes at an angle greater than the critical angle will stay inside the medium (glass, air, etc.). Total internal reflection is when all the light is reflected back inside the medium. The critical angle for glass is about 41°.

Total Internal Reflection: light past the critical angle cannot crease.

Fiber Optics

Fiber optics work by total internal reflection.

Fiber optics pass light through flexible glass or plastic tubes (called fibers). These tubes can be best allowing light so be directed where it is wanted.

PSDor optic scopes can see around cernars.

Fiber optic cables earry much of the communications of our world (Internet and phone) because it travels at the speed of light.

Incandescent Light

Incurdescen (normal kight bulbs make light by very high heat. The filament glows bright when enough electricity flows through it.

Incandercent light is very teefficient because most of the energy is lost as heat.

Types of Lights

Fluorescent Lightbulb

Fluores cent lights are four times more efficient than incandescent halbs. 374 of the energy of an incandescent bulb is lost to heat.

Fluorescent Light

In fluorescent light bulbs electricity excites a gas inside, emitting mostly UV light. The white couting on the outside of the bulb absorbs the UV light and emits white light.

Polarization is used in

Light is a transverse wave (vibrating 90° to the direction of motion).

Normal light is chaotic, with transverse waves moving in all directions. A polarizer allows only light going one direction to go through (like a comb).

Only light in one direction can get through a polariser.

Two polarisers turned 90° can cancel out all light.

no light gets through 2nd polariter

> Polarization also allows small computers and calculators screens to make letters and images.

Glow-in-the-Dark

Glow-in-the-dark (photoluminescent) objects contain the element phosphorous. When phosphorous' electrons are energised, they come down a few at a time, giving off light over time. When all the electrons have fallen the phosphorous goes dark. Visible light recharges them (mising them up) so that they give off light again.

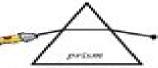

Phosphorous atoms give off light gradually, scenting to glow-in-the-dark.

Lusers

LASER - Light Amplification by Stimulated Emission of Radiation

How Lasers Work

Lasers give off light of one particular wavelength. This comes from foreing a substance (usually a gas) to give off light. This light bounces back and forth between mirrors, causing other atoms to give off more light. When the light is powerful enough it escapes as a laser beam.

Compace laser light refracts, but does not spread out in a prism.

Why We Use Lasers

Laser light is compact: it doesn't spread out like regular light. That's why we use them for pointers and why they don't bend in prisms. Lasers can be powerful. Some lasers are used industry and medicine for precision coming. Military lasers are just now able to blow up incoming missiles.
