Sensors in Agriculture Dimitrios Moshou, 2019-06-12 Agriculture requires technical solutions for increasing production while lessening environmental impact by reducing the application of agro-chemicals and increasing the use of environmentally friendly management practices. A benefit of this is the reduction of production costs. Sensor technologies produce tools to achieve the abovementioned goals. The explosive technological advances and developments in recent years have enormously facilitated the attainment of these objectives, removing many barriers for their implementation, including the reservations expressed by farmers. Precision agriculture and smart farming are emerging areas where sensor-based technologies play an important role. Farmers, researchers, and technical manufacturers are joining their efforts to find efficient solutions, improvements in production, and reductions in costs. This book brings together recent research and developments concerning novel sensors and their applications in agriculture. Sensors in agriculture are based on the requirements of farmers according to the farming operations that need to be addressed.

Quantitative analysis of neuroanatomy Julian M L Budd, Hermann Cuntz, Stephen J Eglen, Patrik Krieger, 2016-03-22 The true revolution in the age of digital neuroanatomy is the ability to extensively quantify anatomical structures and thus investigate structure function relationships in great detail Large scale projects were recently launched with the aim of providing infrastructure for brain simulations These projects will increase the need for a precise understanding of brain structure e g through statistical analysis and models From articles in this Research Topic we identify three main themes that clearly illustrate how new quantitative approaches are helping advance our understanding of neural structure and function First new approaches to reconstruct neurons and circuits from empirical data are aiding neuroanatomical mapping Second methods are introduced to improve understanding of the underlying principles of organization Third by combining existing knowledge from lower levels of organization models can be used to make testable predictions about a higher level organization where knowledge is absent or poor This latter approach is useful for examining statistical properties of specific network connectivity when current experimental methods have not yet been able to fully reconstruct whole circuits of more than a few hundred neurons
