interpretation bias Scramble Sentences Test SST with eye movements being recorded during task Results We found reduction in depressive symptoms together with increase in mindfulness in MBCT group After MBCT participants perceived events as more positive and less stressful and they used significantly fewer negation and discrepancy words Moreover they made more positive interpretations in the SST than before training fixated less on negative keywords and more on positive keywords than at the pre test No such differences were found for the waiting group Conclusions These findings suggest that MBCT can be effective in treating current depression and indicate possible mechanisms underlying therapeutic change
