3. Biologists attached a radio transmitter to one of a number of wolves that had been released earlier in the White River Wilderness Area as part of a reclamation project. The biologists hoped to use this wolf to track the movements of the whole pack. Wolves usually range over a wide area in search of prey, and frequently follow the migration of their prey animals. The biologists were surprised to find that this particular wolf never strayed more than five miles away from the location in which it was first tagged.

Which one of the following, if true, would by itself most help to explain the behavior of the wolf tagged by the biologists?

- a. The area in which the wolves were released was rocky and mountainous, in contrast to the flat, heavily-wooded area from which they were taken.
- b. The wolf had been tagged and released by the biologists only three miles away from a sheep ranch that provided a large, stable population of prey animals.
- c. The White River Wilderness Area had supported a population of wolves in past years, but they had been hunted to extinction.
- d. Although the wolves in the White River Wilderness Area were under government protection, their numbers had been sharply reduced, within a few years of their release, by illegal hunting.
- e. The wolf captured and tagged by the biologists had split off from the main pack whose movements the biologists had hoped to study, and its movements did not represent those of the main pack. Source: of Time
