Transactions on Aspect-Oriented Software Development VI Shmuel Katz, Harold Ossher, 2009-10-26 work for small problems but it introduces significant accidental complexities when tackling larger problems. Not that the real challenge here is not how to design the system to take a particular aspect into account; there is significant design knowledge in industry on this and it is often captured in the form of design patterns. Taking into account more than one aspect can be a little harder but many large scale successful projects in industry provide some evidence that engineers know how different concerns should be handled. The real challenge is reducing the effort that the engineer has to expend when grappling with many interdependent concerns. For example in a product line context when an engineer wants to replace a variant of an aspect used in a system she should be able to do this cheaply, quickly and safely. Manually weaving every aspect is not an option. Unlike many models used in the sciences, models in software and in linguistics have the same nature as the things they model. In software this provides an opportunity to automatically derive software from its model that is to automate the weaving process. This requires models to be formal and the weaving process be described as a program in an executable meta-model manipulating models to produce a detailed design. The detailed design produced by the weaving process can ultimately be transformed to code or at least test suites.

Management of Steel Stringer Bridges Arthur J.
