

Geometry of Circles

Students who successfully complete this primer will be able to:

- Calculate the area and circumference of a circle.
- Apply the relationship between the radius of a circle and an arc length.

Radius, radians, and arc length

In many physics applications, it is necessary to convert between the distance from the center of a circle, the radius r , and the distance along the circumference, called the arc length s . These two parameters are related by the angle θ swept out from the starting point of the arc, typically defined as the x -axis, and the end point ([Figure 1](#)).

Scientists and mathematicians typically measure the angle θ in radians rather than degrees, which is defined as

$$\theta(\text{radians}) = \frac{s}{r} \rightarrow s = r\theta$$

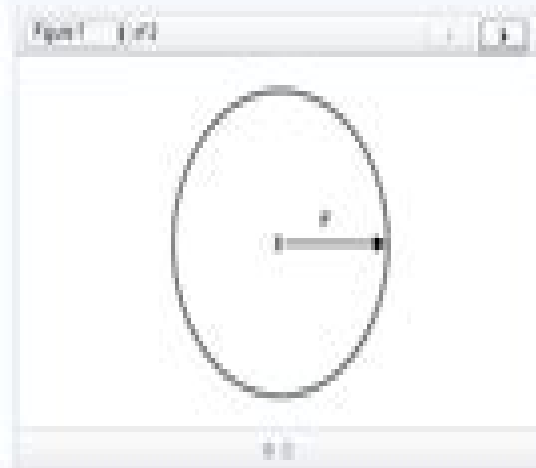

This second formula is another way to write the definition of circumference with s being an arc that comprises an entire circle and r being the radius of the circle. That means that 2π must be the angle of the entire circle:

$$\theta_{\text{full circle}} = 2\pi \text{ radians} = 360^\circ$$

In fact, the radius of a circle can be thought of as a conversion factor between the angular position θ and the arc length s :

$$1 \text{ radius} = 1 \text{ radius} \left(\frac{2\pi \text{ radians}}{360^\circ} \right) = 2\pi \frac{^\circ}{\text{radians}}$$

[Click here](#) to watch a video that walks through the geometry of circles, including a worked-out example. Then answer the questions that follow.

Part C - Determining arc length

What is the length of an arc on a circle of radius 30.0 cm when $\theta = 60^\circ$?

Express your answer (in cm) to three significant figures.

[Hint](#)

s =cm

For all readers interested in calculus based physics: *Designing for Situated Knowledge Transformation* Nina Bonderup Dohn, Stig Børsen Hansen, Jens Jørgen Hansen, 2019-11-27 How can knowledge developed in one context be put to use in other contexts? How can students learn to do so? How can educators design for learning this? These are fundamental challenges to many forms of education. The challenges are amplified in contemporary society where people traverse many different contexts and where contexts themselves are continuously changing. *Designing for Situated Knowledge Transformation* provides a structured answer to these questions through an investigation of the theoretical, empirical, methodological and pedagogical design aspects which they involve. Raising profound questions about the nature of knowledge, of situativity and of transfer, transformation and resituation, it calls for and provides extended empirical studies of the forms of transformation that knowledge undergoes when people find themselves in new contexts while relying on existing knowledge. Considering many avenues of practical application and insight, *Designing for Situated Knowledge Transformation* develops a coherent framework for developing learning designs for knowledge transformation that is crucial in today's educational settings.
