Pavement surface texture is measured in a variety of ways in Virginia Two methods commonly used are ASTM E 965  
Standard Test Method for Measuring Pavement Macrottexture Depth Using a Volumetric Technique known as the sand patch  
test and ASTM E 2157 Standard Test Method for Measuring Pavement Macrottexture Properties Using the Circular Track CT  
Meter In September 2005 staff from the Virginia Transportation Research Council inquired about using the Digital Surface  
Roughness Meter DSRM to measure the surface texture of several concrete and asphalt surfaces Measurements were taken  
on concrete and asphalt surfaces using the DSRM CT meter and sand patch test and the results were compared From the  
data obtained there appears to be a good correlation among the results of the three methods The DSRM and sand patch tests  
appear to be more accurate on surfaces that are not uniform However this may be because the center of the rotating arm of  
the CT meter may have missed particular non uniform areas on the testing surface The use of the DSRM and CT meter  
devices also reduces the probability of human error The sand patch test is exposed to a greater probability of human error it  
is a test that cannot be performed quickly without comprising accuracy The DSRM is a better device to use under a time
