

## Handouts on Marine Steam Plant

### **CHAPTER – I (MARINE STEAM SYSTEMS & STEAM UTILIZATION)**

#### **VARIOUS STEAM SYSTEMS ON BOARD SHIPS**

- Steam is nowadays primarily used on motor ships for heating applications because it can meet large heating requirements with high efficiency.
- In earlier times, steam was used for ship's propulsion which later on shifted to diesel propulsion due to its economy. Steam propulsion was restricted to liquefied gas carriers where the boiler could consume cargo boil of gas as fuel thus obviating the need for a cargo reliquefaction plant.
- With the recent development in diesel engines, steam propulsion on liquefied gas carriers have lost their popularity in favour of diesel engines. As modern diesel engines have been designed to use gaseous fuel which provide them more reliability, require less maintenance and the problem of handling sludge is reduced to a large extent.
- In addition to heating applications, motor ships may also be equipped with other applications as stated below.
- Use of steam for motive power on ships is very expensive due to its poor efficiency as comparison to diesel engine, as most of the latent heat in steam is lost in the condenser.
- Steam is used for motive power on motor ships, when it is produced by waste heat recovery or as a byproduct as described below.
- Steam produced by the waste heat recovery from the exhaust gases of main propulsion diesel engine is used to drive turbo – generator on container ships which have very large electrical power requirement in comparison to other type of ships due to carriage of large number of reefer containers.
- Although the container ship is equipped with a turbo – generator for use while at sea, yet it is not used during the port stay of the vessel as the boiler, being uneconomical, is not designed for high evaporation rate to meet this demand. Diesel generators are used for providing this extra power during ship's port stay.
- Similarly, convention oil tankers use ship's auxiliary boiler for production of inert gas for the safety of cargo tanks against fire and explosion.
- Thus, steam produced is a byproduct, which is used to drive the cargo oil pumps through steam turbines for the discharge of cargo. Similarly, ballast pump may also be operated by using the steam while discharging the cargo. However, electrical driven ballast pump is used while loading the cargo.

#### **USE OF STEAM FOR HEATING & MISCELLANEOUS APPLICATIONS**

- All types of ships may be equipped with the following heating applications.
  - 1 Heating of fuel and lube oil
  - 2 Heating of waste oil and sludge
  - 3 Heating of miscellaneous fluids
