Memorandum Maths Paper November 2010:

Sets and Extensions in the Twentieth Century, 2012-01-24 Set theory is an autonomous and sophisticated field of mathematics that is extremely successful at analyzing mathematical propositions and gauging their consistency strength. It is as a field of mathematics that both proceeds with its own internal questions and is capable of contextualizing over a broad range which makes set theory an intriguing and highly distinctive subject. This handbook covers the rich history of scientific turning points in set theory providing fresh insights and points of view. Written by leading researchers in the field, both this volume and the Handbook as a whole are definitive reference tools for senior undergraduates, graduate students and researchers in mathematics, the history of philosophy and any discipline such as computer science, cognitive psychology and artificial intelligence for whom the historical background of his or her work is a salient consideration. Serves as a singular contribution to the intellectual history of the 20th century. Contains the latest scholarly discoveries and interpretative insights.

Foundations of Artificial Intelligence and Robotics Wendell H. Chun, 2024-12-24 Artificial intelligence (AI) is a complicated science that combines philosophy, cognitive psychology, neuroscience, mathematics and logic, logicism, economics, computer science, computability and software. Meanwhile, robotics is an engineering field that complements AI. There can be situations where AI can function without a robot (e.g. Turing Test) and robotics without AI (e.g. teleoperation), but in many cases each technology requires each other to exhibit a complete system having smart robots and AI being able to control its interactions (i.e. effectors) with its environment. This book provides a complete history of computing, AI and robotics from its early development to state-of-the-art technology, providing a roadmap of these complicated and constantly evolving subjects. Divided into two volumes covering the progress of symbolic logic and the explosion in learning, deep learning in natural language and perception, this first volume investigates the coming together of AI, the mind and robotics, the body and discusses the state of AI today. Key Features: Provides a complete overview of the topic of AI starting with philosophy, psychology, neuroscience and logicism and extending to the action of the robots and AI needed for a futuristic society. Provides a holistic view of AI and touches on all the misconceptions and tangents to the technologies through taking a systematic approach. Provides a glossary of terms, list of notable people and extensive references. Provides the interconnections and history of the progress of technology for over 100 years as both the hardware (Moore's Law, GPUs) and software (i.e. generative AI) have advanced. Intended as a complete reference, this book is useful to undergraduate and postgraduate students of computing as well as the general reader. It can also be used as a textbook by course convenors. If you only had one book on AI and robotics, this set would be the first reference to acquire and learn about the theory and practice.
