edition Excerpt direction is lost in another but erratic motions are caused by the length of the link itself the length of the
eccentric rods and the throw of the eccentric This is only another form of saying that if the radius of the link its point of
suspension the length of the rods and the throw of the eccentrics are not properly designed in the first instance there will be
an erratic motion of the link at one or more points in its stroke Take the radius of the link for example This is conventionally
the distance from the centre of valve stem connection with valve at mid stroke to the centre of the shaft but sometimes if the
connections are very short indeed this gives a very awkward link of short curve so that the link block binds or works hard
then the link is made of longer radius than the centre of the shaft or of such proportions that the engine will reverse easily If
the engine works at full stroke all the time this doesn't matter for the valve can be made to work properly at full stroke
regardless of the link radius If however it is intended to work expansively then difficulties arise at once if the link is of an
improper radius for the lead increases or decreases alarmingly with any shift of the link if the rods are straight connected or
open as it is called If the rods are crossed then the lead decreases toward mid gear It might be supposed that when the rods
are of the proper length and the link is of the correct radius then there would be no motion of the valve with the link in mid
gear but this is not the case for it will be observed by the diagram that the centres of the eccentric wheels and the centre of
the shaft are not coincident so that in a complete revolution there is an eccentricity of *A Manual Of The Steam-engine*
